Memorandum

TO : C/SMS

FROM : DAD/S&D

SUBJECT:

DATE: 15 June 1965

Apparently we haven't been communicating too well on this report. The basic position of the S band measurements doesn't seem to be lined up as I had originally thought it would be. On page 1 for example we still indicate that the values sort of ran all over the map and no average value is given. I think that the report should be modified to say that the S band measurements were to obtain preliminary information upon which the design of equipment specifically intended for this purpose is being built and to put the whole S band out of the report entirely and make an appendix. The range of measurements for example on page 1 is completely inconsistent with the idea of quality measurements. No where in the report do I find an indication of fact that this was a preliminary sort of measurement. On page 12, paragraph 6, we say the S band portion of the [redacted] system is designed to collect and process accurately, etc. This is not the case, this did not happen. I think this report continues to give a false impression. It might even be sufficient to say, as I think you recommended back here a while ago, that preliminary measurements were made and simply remove the whole thing from the report.
